

## Near Miss Reporting

Fiberweb utilises several leading indicator safety metrics, one of which is near miss reporting. Fiberweb recognises that reporting near misses is a critical component of injury prevention and in 2010 the online reporting system was updated and awareness of the programme was reinforced across the Group. These initiatives have resulted in a 60% increase in reporting within the first year. To ensure that these gains are sustained, additional programme enhancements followed by pilot studies are ongoing at selected facilities.
