

The Environment

Fiberweb is committed to developing and promoting products and processes that reduce waste and adverse environmental impacts. This includes both the efficient use of materials and energy in product design and development and an awareness of the effect on the environment of our manufacturing processes.

Fiberweb encourages each of its facilities to develop its own environmental programmes and to work towards reducing its environmental impact. We continue to focus on identifying and improving performance in key areas of environmental impact, which include waste reduction, energy consumption, water consumption, the use of recycled and biodegradable materials and packaging.

Our businesses are encouraged to report all environmental impacts and key performance information is collected twice a year through the Environmental Index, an electronic data collection system. The data is collated annually and provides a means by which our businesses can evaluate their environmental performance and set improvement targets.
